

The gold layer gets acted on, not just queried

Activations is the fourth native NewCo stage, right after Transformations — a restricted-list determination watched inside the same Iceberg gold table dbt just built, synced straight into the trading desk's order management system with no reverse-ETL vendor and no second copy of the data.

TRIGGER restricted_list_check false → true, scoped by desk_id	DESTINATION Bloomberg AIM compliance_rule · upsert	SYNC LATENCY < 2 min gold refresh to live pre-trade block
---	--	--

WHAT YOU SAY	WHAT YOU SHOW
"Compliance just made a restriction call on this holding — it landed in gold.dim_holdings four seconds ago."	Architecture page → Activations panel , Trigger column
"Today that determination is worthless until it's inside the order system actually blocking trades — a compliance analyst exports a spreadsheet, emails it, and a trader keys it into Bloomberg AIM by hand. Three to six hours of exposure."	/activations-live → Segment Definition → Field Mapping steps
"Watch NewCo push ticker, CIK, desk scope, and the embargo window straight into AIM's compliance rule — no export, no re-key."	/activations-live → Sync Preview → API Push steps
"And here it is, landed in AIM's restricted-security list, timestamped under two minutes later — reason code and desk scope attached."	/activations-live → Destination Confirmation table
"Before, this was a manual export-and-rekey pipe bolted on after the fact. Now it's one platform, one lineage graph, and the exposure window is closed."	Architecture page → Before/After panel , Reverse-ETL hop row
